XYMAX OVERVIEW Your shield against corrosion

Xymax coatings are based on moisture-cure technology, which is one of the most advanced technologies available. Xymax offers a full line of one-component moisture-cure polyurethane coatings whose application is not restricted by climatic condition. It can be applied in cold, damp, humid or foggy conditions, and can cure at temperatures as low as -7°C with minimal surface preparation.

Xymax has been recognized to have the best overcoat paint system, providing excellent corrosion resistance and long-lasting durable protection. Single-component technology makes a most practical, user-friendly coating. Faster re-coating time and minimal surface preparation reduces the cost of painting, downtime, delays, and increases productivity.
